ATTORNEY DOCKET: AUS920010938US1   PATENT

Section I: AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A method for extracting identification information from a software package, said software package including a number of software modules organized in a manner determined by said identification information, said method comprising:

determining an organization of said software modules within said software package; and

extracting said identification information from said organization of said software package.

2. (Currently Amended) The method as set forth in claim 1 wherein said software package comprises software modules coupled together in a manner representative of said identification information.

3. (Original) The method as set forth in claim 2 wherein said software modules are coupled together by compiling said software modules into an executable form of said software package.

4. (Original) The method as set forth in claim 2 wherein said software modules are coupled together by linking said software modules into an executable form of said software package.

5. (Currently Amended) The method as set forth in claim 1 and further including:

analyzing said software package to determine an organizational relationship among said software modules; and

ATTORNEY DOCKET: AUS920010938US1   PATENT

determining a <u>binary series</u> ~~first format~~ from said organizational relationship of said software modules.

6. (Currently Amended) The method as set forth in claim 1 and further including transmitting said <u>software package</u> ~~organization~~ over a network to a requesting terminal, said requesting terminal being enabled to extract said <u>identification</u> information from said organization of said <u>modules of said</u> software package.

7. (Original) The method as set forth in claim 6 wherein said software package is transmitted from a user terminal over an Internet network to a server.

8. (Original) The method as set forth in claim 6 wherein said user terminal is a wireless device.

9. (Original) The method as set forth in claim 6 wherein said user terminal is a personal computer system.

10. (Currently Amended) The method as set forth in claim 1 wherein said <u>identification</u> information includes an identification of a user of said software package.

11. (Currently Amended) The method as set forth in claim 1 wherein said <u>identification</u> information includes an identifying number related to said software package.

12. (Currently Amended) The method as set forth in claim 11 wherein said <u>identification</u> information further includes an identification of a user of said software package.

13. (Original) The method as set forth in claim 1 wherein said software modules are organized in a series of sets of software

Page 3 of 11

modules, each of said sets comprising a predetermined number of software modules.

14. (Currently Amended) The method as set forth in claim 13 wherein said series of sets corresponds to ~~first format is~~ a binary series ~~format~~, and each of said sets comprises first and second software modules, said binary series ~~first format~~ being determined in accordance with a ~~an order of~~ sequence of said first and second software modules within said sets of said software modules.

15. (Currently Amended) The method as set forth in claim 13 wherein said series of sets is organized in ~~first format is~~ other than a binary format, each of said sets comprising a number of said software modules other than two, said identification information ~~first format~~ being determined according to an order in which said number of software modules are sequenced within said sets of software modules.

16. (Currently Amended) A medium including machine readable coded indicia, said machine readable coded indicia being selectively operable in combination with a processing circuit for extracting embedded identification information from a software package by determining an organization of software modules within said software package, ~~said software package being organized into a number of software modules~~ wherein relationships between said software modules are representative of said identification information embedded within said software package.

17. (Original) The medium as set forth in claim 16 wherein said medium is an optically encoded disk.

Page 4 of 11

ATTORNEY DOCKET: AUS920010938US1   PATENT

18. (Original) The medium as set forth in claim 16 wherein said medium is a magnetically encoded magnetic diskette.

19. (Original) The medium as set forth in claim 16 wherein said software package resides on a storage device within a computer device.

20. (Original) The medium as set forth in claim 16 wherein software package resides on a memory device within a computer device.

21. (Currently Amended) The medium as set forth in claim 16 wherein said embedded identification ~~predetermined~~ information includes an identification of a user of said software package.

22. (Currently Amended) The medium as set forth in claim 16 wherein said embedded identification information includes an identifying number related to said software package.

23. (Currently Amended) The medium as set forth in claim 22 wherein said embedded identification information further includes an identification of a user of said software package.

24. (Currently Amended) A network arranged to enable extracting of organizational information of an organization of software modules within a software package at a user terminal and transferring said organizational information to a server for use in deriving identification information embedded within said organizational information, said network comprising:

a user terminal at which said software package resides;

a server; and

ATTORNEY DOCKET: AUS920010938US1   PATENT

an interconnection between said server and said user terminal,
said user terminal being responsive to a request to upload said
organizational information of said software package for
determining said organizational information and transferring said
organizational information to said server.
